

HYDROCULTURE PLANTS PLANTING GUIDE

YOUR HYDROCULTURE PLANT IS SHIPPED IN A NURSERY SLEEVE AND THESE STEPS BELOW ARE ADDITIONAL STEPS YOU CAN TAKE TO PUT THE PLANT IN A PERMANENT HOME.

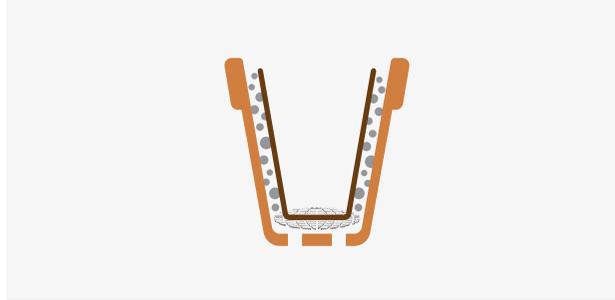

1. INSTALLING A LINER/ CACHEPOT

A liner or cache pot is needed to make the planter entirely watertight. Ensure the liner is the same depth as the size of the plant's cultivation pot.

2. ADD NUTRIENTS

Now sprinkle solid hydroculture feed in the liner. Use liquid or hard pellet fertilizer based on instructions on the product.

3. PLACE THE PLANT INTO THE POT

Now, place the plant on the bottom of the liner. Note: always leave the plant in the cultivation pot. Use a water meter to help you determine moisture content or purchase a self watering planter.

4. TOP UP WITH GRANULES

Top up the planter with more Hydro granules and place a layer of decorative stones on top as required.

The granules could produce white deposits after a while. These white deposits are minerals and not mould, as many people assume. They are totally harmless to the plant. A layer of decorative stones or mineral substrate will prevent the visibility of these deposits.

Additional Requirements:

- Self Watering Planter
- Liner
- Hydroculture plant feed
- Hydro granules
- Mineral Substrate
